Replit proof of use

DecisionOS | Replit development workspace | 23 October 2026 MYT

Workspace: replit.com/@jeremyjunxuanta/orbyte-decisionos
Source imported from local commit **ef2db83**; subsequent fixes cover pip user mode, test database isolation and installed Chromium selection.

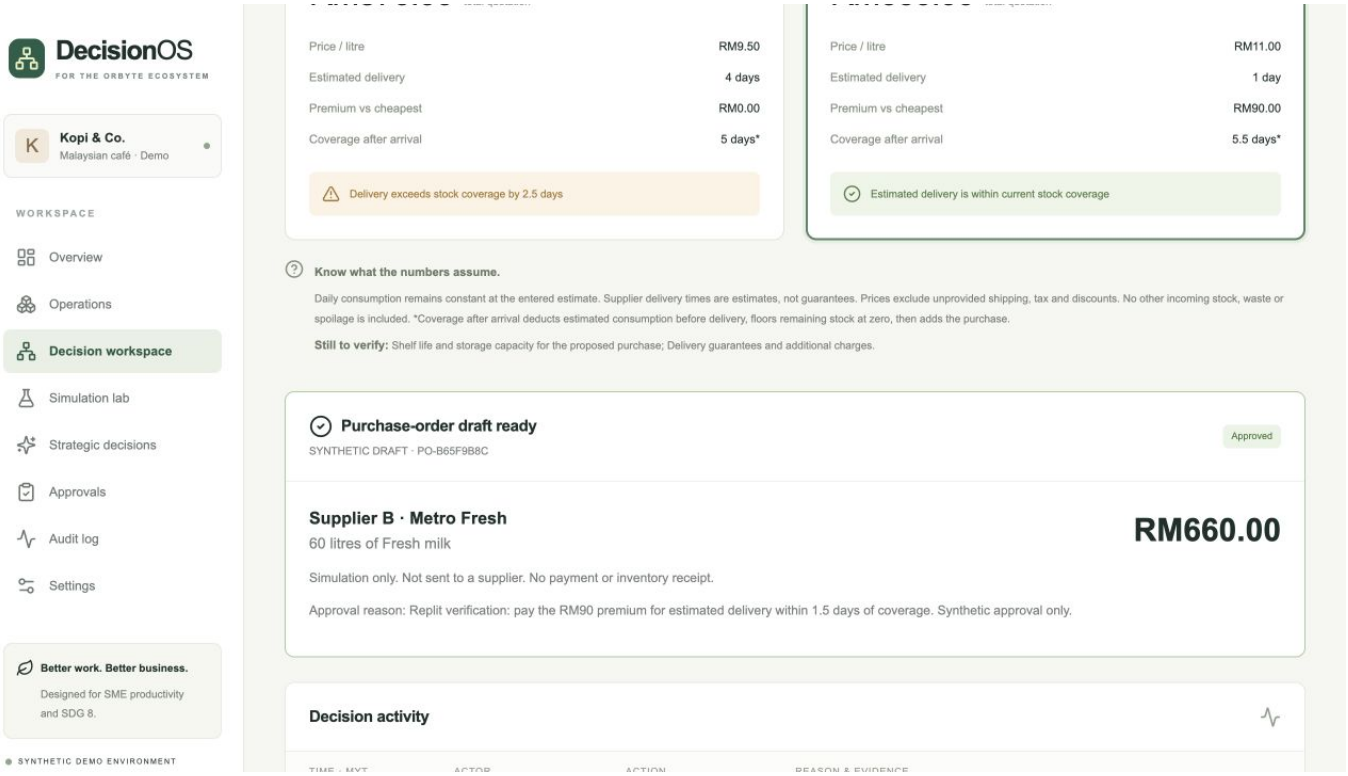

Actual authenticated workspace showing the approved synthetic decision in its embedded preview. The project was imported, installed, built and run here. This is development-preview evidence; no production publication or sponsor-credit use is claimed.

Approved workflow and persistence

DecisionOS | Replit development workspace | 23 October 2026 MYT

Native-browser verification completed: inventory shortage, quotation comparison, simulated owner approval, purchase-order draft and persistent audit. Reload retained the approved decision and draft.

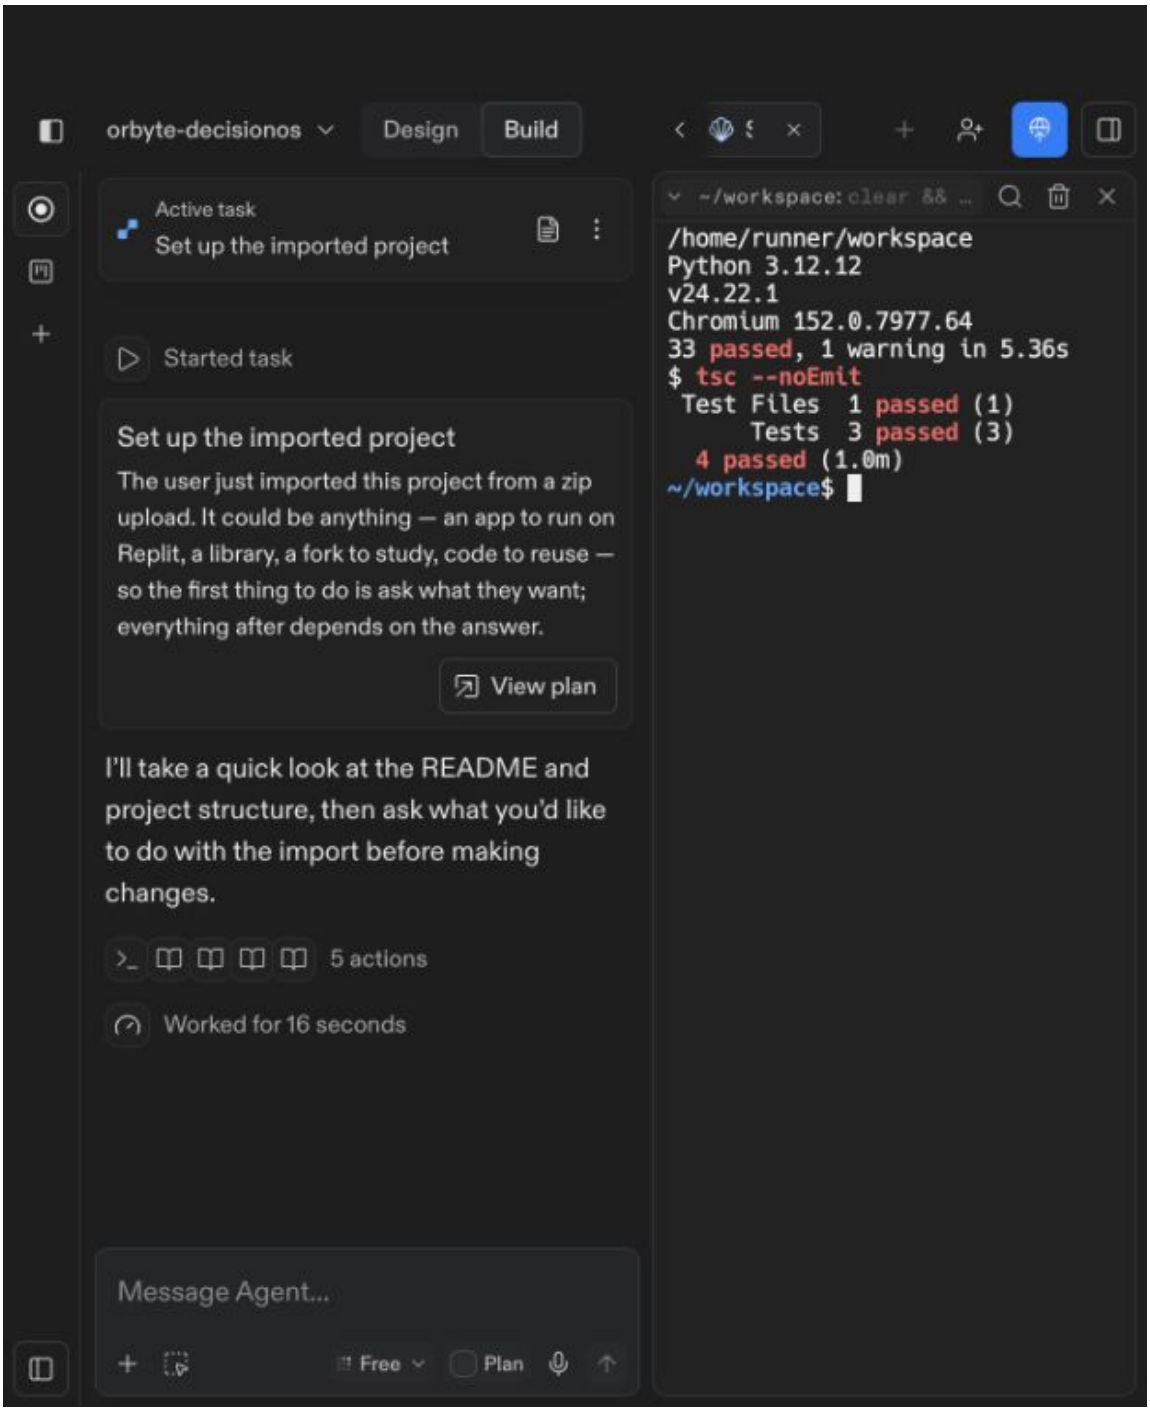

Decision: e4dc959a-2ce6-4ea4-adcc-e6307028f737
Purchase draft: PO-B65F9B8C
Selected: Supplier B / Metro Fresh; 60 litres of milk; RM660 total.
Arithmetic: 18 / 12 = 1.5 days coverage; RM90 premium over Supplier A.
Approval recorded: 23 October 2026, 19:29 MYT.

The screenshot is from the genuine Replit development preview, captured after reload. All records are invented. No supplier was contacted, no payment occurred and no inventory receipt was recorded. Selectable demo roles are not production authentication. The workspace may sleep; this does not establish durable production hosting.

Verification in the Replit runtime

DecisionOS | Replit development workspace | 23 October 2026 MYT

Passed: 33 backend tests, 3 component tests, TypeScript checks, production build and all 4 Playwright tests (1.0 minute). Python 3.12.12; Node 24.22.1; installed Chromium 152.0.7977.64.

The terminal summary reads the actual saved test logs. Bundled Chromium initially lacked libglib; the successful run explicitly used /repl/tools/bin/chromium. GitHub CI has not run. The test harness uses isolated synthetic data and disables external simulations.
